

# React Application Hosting

Last updated by | shakibesaib | Aug 15, 2023 at 5:14 PM GMT+6

---

First we have to make sure our react app is ready for deployment.

## N-ginx configuration:

```
sudo nano /etc/nginx/sites-available/react.conf
```

```
server {
    listen 80;
    server_name react.local;

    location / {
        root /home/devops/Desktop/React/my-app/build;
        index index.html;
        try_files $uri $uri/ /index.html;
    }
}
```

- Restart nginx

## Apache configuration:

```
sudo nano /etc/apache2/sites-available/react.conf
```

```
<VirtualHost *:80>
    DocumentRoot "/home/devops/Desktop/React/my-app/build"
    ServerName localhost
```

```
    <Directory "/home/devops/Desktop/React/my-app/build">
        Options Indexes FollowSymLinks
        AllowOverride All
        Require all granted
    </Directory>
```

```
</VirtualHost>
```

- Restart apache
