

# Bash Loop

Last updated by | Shakibe Hasan | Jun 9, 2023 at 6:22 PM GMT+6

---

**Bash loops are very useful. Loops allow us to take a series of commands and keep re-running them until a particular situation is reached. They are useful for automating repetitive tasks.**

**There are three types of Loop in Bash:**

- For loop
- While loop
- Until loop

**For loop:** For each of the items in a given list, perform the given set of commands.

**While loop:** While an expression is true, keep executing these lines of code.

**Until loop:** This loop will execute the commands within it until the test becomes true.
